

Cardiology Workflow Examples: From Chest Pain to Cath Lab

Three real-world flows CareDesk routes automatically, surfacing risk, respecting your monitoring windows, and keeping your cath lab full.

See How Your Cardiology Calls Get Resolved

Generic scheduling software can't distinguish a refill call from a red-flag symptom. **CareDesk was built for specialty cardiology from the ground up**, surfacing urgency cues, enforcing monitoring windows, and coordinating procedures so your team never starts cold.

WORKFLOW 01

New Chest Pain Call

New-onset symptoms and acute cases are differentiated automatically. Your patient is advised to visit the ER or booked into an urgent evaluation slot based on your criteria, with full history captured and guided next steps ready for your staff.

WORKFLOW 02

Post-Heart Attack (Post-MI) Follow-Up

Your required monitoring window is identified automatically, your patient routes to the right provider and modality, and potential delays are flagged before they impact care.

WORKFLOW 03

Blood Thinner (Anticoagulation) Adjustment

Your patient's INR checks or follow-ups are scheduled within your required timeframe, the care plan is documented, and patient instructions confirmed automatically.

What Your Peers Are Seeing

A patient mentioned 'chest tightness when walking upstairs' during a refill call. Elevate Copilot immediately flagged: 'New exertional chest pain described, assess urgency for stress test.' That risk recognition is exactly what we need when non-clinical staff field calls.

CARDIOVASCULAR ASSOCIATES

Our cath lab utilization increased 18% after implementing CareDesk. It coordinates pre-procedure requirements, anticoagulation, and post-procedure follow-up automatically. We're not scrambling to fill last-minute cancellations anymore.
